(54) Title: AUTOMATIC CELLULAR PHONE BATTERY CHARGING BY MOBILE PERSONAL COMPUTER

## (57) Abstract

A PCMCIA card (18) having cellular phone battery charging circuitry (19), and an adapter cable (23) having a PCMCIA card connector (22) equipped with a battery characteristic encoder (21), are provided to charge a cellular phone battery (13), using power supplied by a mobile PC (10), in accordance to battery characteristic information provided by the battery characteristic encoder (21). Starting and stopping of charging operation is preferably controlled by mobile PC (10). Furthermore, starting and stopping of charging operation is preferably automated with charging software application (11) executing on mobile PC (10).

## Automatic Cellular Phone Battery Charging By Mobile Personal Computer

5

### BACKGROUND OF THE INVENTION

#### 1. Field of the Invention

10

The present invention relates to the field of cellular phone battery. More specifically, the present invention relates to the charging of cellular phone battery by mobile personal computer (PC).

#### 2. Background Information

15

Today, cellular phone and mobile PC have become indispensable business equipment to many business and technical professionals, particularly those who travel frequently. Typically, users who travel with both of these equipment would carry two separate incompatible battery chargers, one for charging the cellular phone battery, and the other for charging the mobile PC battery. This prior art approach to charging the various batteries is cumbersome and less than desirable. It would be a lot more desirable if one of the battery chargers can be eliminated. As will be disclosed in more details below, the present invention provides for a method and apparatus for charging the cellular phone battery by the mobile PC that achieves the desired and other results.

20

25

## SUMMARY OF THE INVENTION

The desired results are advantageously achieved by providing an otherwise conventional PCMCIA card with additional cellular phone battery charging circuitry, and an otherwise conventional adapter cable with a PCMCIA card connector at one end, having a battery characteristic encoder. The adapter cable in conjunction with the PCMCIA card couples the cellular phone battery to a mobile PC. The cellular phone battery charging circuitry, using power supplied by the mobile PC, charges the cellular phone battery, in accordance to battery characteristic information provided by the battery characteristic encoder. Preferably, starting and stopping operation of cellular phone battery charging circuitry is controlled by mobile PC.

In one embodiment, the cellular phone battery charging circuitry comprises a two stage DC-DC converter and an addressable flip-flop. <<The first stage is used to ramp up the voltage and the second stage serves as a limited current adjustable power supply.>> The battery characteristic encoder comprises a number of control lines strapped in a cellular phone battery specific manner, denoting the cellular phone battery's required charging voltage, current and slope profile. Mobile PC is provided with a cellular phone battery charging software application including a monitor routine for automatically controlling operation of cellular phone battery charging circuitry and an end user interface for customizing the control of cellular phone battery charging circuitry.

In an alternate embodiment, battery characteristic encoder comprises a number of resistors for providing charging voltage, current, and slope feedback to the mobile PC.

### BRIEF DESCRIPTION OF DRAWINGS

The present invention will be described by way of exemplary embodiments, but not limitations, illustrated in the accompanying drawings in which like references denote similar elements, and in which:

**Figure 1** illustrates charging of a cellular telephone battery by a mobile PC in accordance to the teachings of the present invention;

**Figure 2** illustrates one embodiment of the PCMCIA card of **Figure 1** in further detail;

**Figures 3a-3b** illustrate two embodiments of the PCMCIA connector end of the connecting cable of **Figure 1** in further detail;

**Figure 4** illustrates an architectural view of one embodiment of the mobile PC of **Figure 1**;

**Figure 5** illustrates a software view of one embodiment of the mobile PC of **Figure 1**;

**Figures 6a - 6b** illustrate two exemplary user interface windows of cellular phone battery charger application of **Figure 5**.

## DETAILED DESCRIPTION OF THE INVENTION

In the following description, for purposes of explanation, specific numbers, materials and configurations are set forth in order to provide a thorough understanding of the present invention. However, it will be apparent to one skilled in the art that the present invention may be practiced without the specific details. In other instances, well known features are omitted or simplified in order not to obscure the present invention.

10

Figure 1 illustrates charging of cellular phone battery 13 by a mobile PC 10 in accordance to the present invention. More specifically, battery 13 of cellular phone 12 is charged by charging circuitry 19 of the present invention, provided to PCMCIA card 18, using DC power of mobile PC 13, and in accordance to charging parameter information provided by battery characteristic encoder 21 of the present invention, provided to PCMCIA connector 22 of adapter cackle 23. Charging parameter information includes required charging voltage, charging current and charging slope of battery 13.

20

Cellular phone 12 includes battery 13 and adapter socket 26. Battery 13 of cellular phone 12 is designed to supply cellular phone 12 with DC power, enabling cellular phone 12 to operate in standalone mode for an extended period of time without being connected to an AC power source. Battery 13 by way of examples may be NI-CAD or NI-MH type of batteries. Operation includes making and

receiving calls as well as stand by to receive calls. As the DC power of battery 13 are drained or consumed by cellular phone 12, battery 13 must be recharged. Unlike the prior art approach of removing battery 13 from cellular phone 12 and recharging it using an "off-line" battery  
5 charger, under the present invention, battery 13 is recharged with battery 13 remain installed in cellular phone 12.

Adapter socket 26 is used for delivering the charging power to battery 13. Preferably, adapter socket 26 is simply a  
10 conventional adapter socket for receiving DC power from a DC power source, such as a car cigarette lighter, found in most cellular phones. Thus, except for the manner battery 13 is charged under the present invention, cellular phone 12 including its battery 13 and adapter socket 26 is intended to represent a broad category of cellular phones known  
15 in the art. Their constitutions and functions are well known and will not be otherwise further described.

Cellular phone 12 including battery 13 and adapter socket 23 is coupled to PCMCIA card 18, by way of adapter cable 23. Adapter  
20 cable 23 includes a cellular phone connector 24 at one end, and a PCMCIA connector 22 at the other end. Cellular phone connector 24 mates with adapter socket 26, whereas PCMCIA connector 22 mates with receiver socket 20 of PCMCIA card 22. For the illustrated embodiment, cellular phone connector 24 is simply a conventional  
25 cellular phone connector found in many prior art adapter cables, whereas PCMCIA connector 22 is provided with battery characteristic

encoder 21 of the present invention. However, based on the description to follow, it will be apparent to those skilled in the art that charging characteristic encoder 21 may also be disposed in cellular phone connector 24 instead. As will be described in more detail below, battery characteristic encoder 21 is cellular phone battery type specific. In other words, adapter cable 23 is cellular phone battery type specific. Except for charging characteristic encoder 21, adapter cable 23 is intended to represent a broad category of like elements known in the art, whose constitutions and functions are well known, and will not be otherwise further described. Battery characteristic encoder 21 will be described in more detail below with additional references to **Figures 3a - 3b**.

PCMCIA card 18 comprises the earlier described receiver socket 20 and cellular phone battery charging circuitry 19 of the present invention. Except for cellular phone battery charging circuitry 19, PCMCIA card 18 is intended to represent a broad category of such cards known in the art, including but not limited to fax/modem cards. In view of the close functional relationship between fax/modem PCMCIA cards and cellular phones, fax/modem PCMCIA cards are actually ideal candidates for incorporating the cellular phone battery charging circuitry 19 of the present invention. The constitutions and functions of the various PCMCIA cards available in the market are well known, and will not be otherwise further described. Cellular phone battery charging circuitry 19 will be described in more detail below with additional references to **Figure 2**.

PCMCIA card **18** is coupled to mobile PC **10** by way of receiver socket **16**. Mobile PC **10** in turn may be connected to an AC power source via PC battery charger **14**. However, it will be apparent to those skilled in the art from the description to follow that the present invention may be practiced with or without mobile PC **10** being connected to an AC power source. Furthermore, the present invention may be practiced with non-mobile computers provided they are equipped to receive PCMCIA card **18** or use a similar card designed for a PC local bus (e.g. EISA, ISA or PCI). By way of example, non-mobile computers may be a properly equipped desktop PC at the traveling user's home or destination location.

In addition to receiver socket **16**, mobile PC **10** further comprises battery **15** and preferably means for controlling starting and stopping operation of cellular phone battery charging circuitry **19** of PCMCIA card **18**. Preferably, receiver socket **16** is simply a standard conforming PCMCIA card receiver socket. In one embodiment, means for controlling starting and stopping operation of cellular phone battery charging circuitry **19** includes cellular phone battery charging software application **11**. Except for cellular phone battery charging software application **11**, mobile PC **10** is intended to represent a broad category of mobile PCs known in the art, whose constitutions and functions are well known, and will not be otherwise further described. An exemplary cellular phone battery charging software application **11** will be

described in more detail below with additional references to **Figures 4**  
- **6**.

Having given an overview description of the present  
invention, cellular phone battery charging circuitry **19**, battery  
characteristic encoder **21** and an exemplary cellular phone battery  
charging software application **11** will now be further described in order  
with additional references to the remaining figures. However, before  
describing these elements of the present invention in detail, it should be  
noted that in view of the novel placements of the various  
hardware/software elements, the present invention may be  
advantageously practiced without requiring any modifications to cellular  
phones **12** and mobile PC **10** (except loading of software application  
**11**).

15

**Figure 2** illustrates one embodiment of cellular phone  
battery charging circuitry **19** and PCMCIA card **18** in further detail. For  
the illustrated embodiment, cellular phone battery charging circuitry **19**  
includes DC-DC converter **44** and an addressable flip-flop **40** coupled  
to each other as shown. Additionally, DC-DC converter **44** is coupled to  
mobile-PC **10** by way of power input line **34** and standard conforming  
PCMCIA plug **28**, and to adapter cable **23** by way of control signal lines  
**46**, power output line **48** and receiver socket **20**.

25

<<DC-DC converter **44** is a two stage DC-DC converter.  
The first stage is used to ramp up the PCMCIA voltage (5v) to a higher

voltage (e.g. 15v). The second stage serves as a limited current adjustable power supply. Suitable DC-DC converters for the first stage include MAX 772 5-15v 1A DC-DC converter manufactured by MAXIM Integrated Products of Sunnyvale, CA, and suitable DC-DC converters  
5 for the second stage include LM205 manufactured by National Semiconductors of Santa Clara, CA. >>

DC-DC converter 44 is turn on or off by flip-flop 40. While in an "On" state, DC-DC converter 44 receives DC power from power  
10 input line 34, and outputs converted DC power on power output line 48, in accordance to charging parameter information received over control signal lines 46. As described earlier, the charging parameter information includes the required charging voltage, charging current and charging slope of battery 13.

15

Flip-flop 40 is coupled to PCMCIA interface circuitry 30 by way of a data input line 36 and a load control line 38. As shown, PCMCIA interface circuitry 30 includes address decoding circuitry 32. Flip-flop 40 is mapped in PCMCIA configuration space. Flip-flop 40 is  
20 set and reset by mobile PC 10, by writing a "1" and a "0" bit to the particular PCMCIA configuration address.

While the cellular phone battery charging circuitry 19 has been described with an embodiment having its DC-DC converter 44  
25 turn on/off by addressable flip-flop 40, it is readily apparent to those

skilled in the art that DC-DC converter 44 may be turned on/off by a variety of other simple hardware and software approaches.

**Figures 3a - 3b** illustrate two embodiments of battery characteristic encoder 21 in further detail. **Figure 3a** illustrates an analog approach, whereas **Figure 3b** illustrates a digital approach. For the analog embodiment, battery characteristic encoder 21 includes shunt resistor R1 for providing current feedback, resistors R2 and R3 for providing voltage feedback, and resistor R4 for selecting the charging slope. The values for resistors R1 - R4 are cellular phone battery specific. <<By way of example, for a M715 battery used in NOKIA Cityman cellular phone (7.2v 850 mAh), the resistances of R1-R4 are 9.5K, 3.15K, 0.4, and 360 ohms respectively.>> For the digital embodiment, five control lines 46 are provided to select one of thirty-two predetermined charging voltage, current and slope combinations ( $2^{**5} = 32$ ). The particular strapping of control lines 46 is cellular phone battery specific.

**Figure 4-5 and 6a-6b** illustrate one exemplary cellular phone battery charging software application 11. **Figure 4** illustrates the relevant hardware elements of mobile PC 10 executing exemplary cellular phone battery charging software application 11. **Figure 5** illustrates other software elements on mobile PC 10. **Figure 6a - 6b** illustrate two essential end user interface windows 134a - 134b of exemplary cellular phone battery charging software application 11.

As illustrated in **Figure 4**, mobile PC **10** includes CPU **110**, cache memory **114**, main memory **118**, memory controller **116** and CPU bus **112** coupled to each other as shown. Mobile PC **10** further comprises bus controller **120**, various I/O devices **124** and I/O bus **122** coupled to each other as shown. Memory controller **118** and bus controller **120** are also coupled to each other. PCMCIA card **18** incorporated with the teachings of the present invention is coupled to I/O bus **122**. Additionally, bus controller **120** includes BIOS registers (not shown) for storing control and status information of battery **15** of mobile PC **10** and BIOS firmware for detecting the status of battery **15** and storing the control and status information into BIOS registers accordingly. Control and status information includes in particular the charge level of battery **15**.

As illustrated in **Figure 5**, in addition to exemplary cellular phone battery charging application **11**, mobile PC **10** further preferably executes a window based operating system **126** including window subsystem **128** for providing various system services including "windowing" services for presenting windowed end-user interfaces to user of mobile PC **10**. Exemplary cellular phone battery charging application **11** includes end user interface **134** and monitor routine **136**. Monitor routine **136** monitors the above described BIOS registers for predefined conditions. Whenever the predefined conditions are satisfied, monitor routine **136** starts/stops operation of cellular phone battery charging circuit **19** accordingly. For the above described embodiment where addressable flip-flop **40** is employed, monitor

routine 136 starts and stops operation of cellular phone battery charging circuit 19, by writing to the predetermined configuration address in the PCMCIA configuration space.

- 5                   As illustrated in **Figures 6a - 6b**, end user interface 134 includes first and second windows 134a - 134b. From first window 134a, user of mobile PC 10 may select automatic charging of cellular phone battery 13, button 138, and a PC battery condition for governing the starting/stopping of cellular phone battery charging, input box 142.
- 10   User of mobile PC 142 may further specify the locations of the above described BIOS registers and other related control information indirectly, by selecting one of a number supported mobile PC types (brand A, brand B etc.), selection box 140. These information by PC type may be provided to the cellular phone charging application 11 either statically
- 15   or dynamically. From second window 134b, which is displayed upon selection of the "manual" way of providing the locations of the above described BIOS registers and other related control information in first window 134a, user of mobile PC 10 may specific the starting address of the BIOS registers, input box 146, as well as first and second bit
- 20   patterns for denoting charging of cellular phone battery is active or inactive. As illustrated, in either window 134a or 134b, user of mobile PC 10 is also provided with the ability to disable cellular phone battery charging, button 136, and the ability to enable cellular phone battery charging unconditionally, button 144.

Thus, a method and apparatus for automatic cellular phone battery charging by mobile personal computer has been described. While the methods and apparatus of the present invention have been described in terms of the above illustrated embodiments, 5 those skilled in the art will recognize that the invention is not limited to the embodiments described. The present invention can be practiced with modification and alteration within the spirit and scope of the appended claims. The description is thus to be regarded as illustrative instead of restrictive on the present invention.

**CLAIMS**

What is claimed is:

- 1 1. A PCMCIA card comprising:
  - 2 a) a first connector for mating with a receiver socket of a computer
  - 3 and receiving first DC power at a first voltage level from the computer
  - 4 through the receiver socket;
  - 5 b) cellular phone battery charging circuitry coupled to the first
  - 6 connector for receiving the first DC power, converting the first DC power
  - 7 to second DC power at a second voltage level in accordance to battery
  - 8 charging parameter information received, and outputting the second DC
  - 9 power;
  - 10 c) a second connector coupled to the cellular phone battery
  - 11 charging circuitry for coupling the cellular phone battery charging
  - 12 circuitry to a battery characteristic encoder for receiving the battery
  - 13 charging parameter information from the battery characteristic encoder
  - 14 and passing on the battery charging parameter information to the
  - 15 cellular phone battery charging circuitry, and for coupling the cellular
  - 16 phone battery charging circuitry to a cellular phone battery for receiving
  - 17 the second DC power from the cellular battery charging circuitry and
  - 18 charging the cellular phone battery with the second DC power.
- 1 2. The PCMCIA card as set forth in claim 1, wherein the cellular
- 2 phone battery charging circuitry comprises a DC-DC converter coupled
- 3 to the first and second connectors for receiving the first DC power,

4 converting the first DC power to the second DC power in accordance to  
5 the cellular phone battery charging parameter information received, and  
6 outputting the second DC power.

1 3. The PCMCIA card as set forth in claim 2, wherein the cellular  
2 phone battery charging circuitry further comprises a flip-flop coupled to  
3 the DC-DC converter for outputting an enabling/disabling signal for  
4 enabling/disabling the DC-DC converter.

1 4. The PCMCIA card as set forth in claim 3, wherein  
2 the first connector is further equipped to receive addresses and  
3 data from the computer for setting/resetting the flip-flop to output the  
4 enabling/disabling signal;  
5 the PCMCIA card further comprises PCMCIA interface circuitry  
6 coupled to the first connector, including address decoding circuitry, for  
7 responding to the received addresses and data;  
8 the flip-flop is further coupled to the PCMCIA interface circuitry  
9 and mapped to an configuration address of a PCMCIA configuration  
10 address space.

1 5. A cellular phone adapter cable comprising:  
2 a first connector for mating with a PCMCIA card, providing the  
3 PCMCIA card with battery charging parameter information, and  
4 receiving DC power output by the PCMCIA card in accordance to the  
5 battery charging parameter information provided;

6 a cable having a first end coupled to the first connector for  
7 transporting the DC power;  
8 a second connector coupled to a second end of the cable for  
9 mating with a cellular phone for providing the DC power to the cellular  
10 phone including charging a battery of the cellular phone.

1 6. The cellular phone adapter cable as set forth in claim 5, wherein  
2 the first connector comprises a battery characteristic encoder for  
3 providing the battery charging parameter information to the PCMCIA  
4 card.

1 7. The cellular phone adapter cable as set forth in claim 6, wherein  
2 the battery characteristic encoder comprises a plurality of resistors for  
3 providing a charging voltage feedback, a charging current feedback,  
4 and a charging slope feedback to the PCMCIA card as the battery  
5 charging parameter information.

1 8. The cellular phone adapter cable as set forth in claim 6, wherein  
2 the battery characteristic encoder comprises a plurality of control lines  
3 strapped in manner to denote one of a plurality of predetermined  
4 charging voltage, charging current, and charging slope combinations as  
5 the battery charging parameter information.

1 9. The cellular phone adapter cable as set forth in claim 5, wherein,

2       the second connector comprises a battery characteristic encoder  
3       for providing the battery charging parameter information to the PCMCIA  
4       card; and  
5       the cable further transports the battery charging parameter  
6       information.

1   10.   A mobile personal computer (PC) comprising:  
2       a receiver socket for mating with a PCMCIA card having cellular  
3       phone battery charging circuitry, and supplying first DC power at a first  
4       voltage level and control signals to the cellular phone battery charging  
5       circuitry, the control signals enabling/disabling the cellular battery  
6       charging circuitry, and when enabled, the cellular battery charging  
7       circuitry converting the first DC power to a second DC power at a  
8       second voltage level in accordance to charging parameter information  
9       received, and outputting the second DC power; and  
10       control means coupled to the receiver socket for generating the  
11       control signals for the cellular phone battery charging circuitry.

1   11.   The mobile PC as set forth in claim 10, the control means  
2       comprises writing means coupled to the receiver socket for generating  
3       the control signals by selectively writing a "1" bit or a "0" bit to a  
4       predetermined configuration address of a PCMCIA configuration  
5       address space.

1   12.   The mobile PC as set forth in claim 10, wherein

2           the mobile PC further comprises a battery for supplying DC power  
3 to the mobile PC; and  
4           the control means comprises  
5                 one or more BIOS registers for storing control and status  
6                 information of a battery of the mobile PC, and  
7                 monitor means coupled to the BIOS register(s) for  
8                 monitoring the stored control and status information  
9                 and detecting for a predetermined condition.

1   13.   The mobile PC as set forth in claim 12, wherein the control means  
2 automatically generates the control signals whenever monitor means  
3 detects the predetermined condition.

1   14.   The mobile PC as set forth in claim 13, wherein the mobile PC  
2 further comprises a power adapter coupled to an AC power source and  
3 the battery for transforming AC power into DC power for charging the  
4 battery.

1   15.   The mobile PC as set forth in claim 10, wherein the control means  
2 comprises an end user interface for accepting user preferences and/or  
3 commands related to the generation of the control signals for the cellular  
4 phone battery charging circuitry.

1   16.   A computer comprising:  
2           a receiver socket for mating with a PCMCIA card having cellular  
3 phone battery charging circuitry, and supplying first DC power at a first

4 voltage level and control signals to the cellular phone battery charging  
5 circuitry, the control signals enabling/disabling the cellular battery  
6 charging circuitry, and when enabled, the cellular battery charging  
7 circuitry converting the first DC power to second DC power at a second  
8 voltage level in accordance to charging parameter information received,  
9 and outputting the second DC power;

10 control means coupled to the receiver socket for generating the  
11 control signals for the cellular phone battery charging circuitry.

1 17. The computer as set forth in claim 16, the control means  
2 comprises writing means coupled to the receiver socket for generating  
3 the control signals by selectively writing a "1" bit or a "0" bit to a  
4 predetermined configuration address of a PCMCIA configuration  
5 address space.

1 18. A mobile computing system comprising:  
2 a) a mobile personal computer (PC) including a first battery for  
3 outputting first DC power at a first voltage level;  
4 b) a PCMCIA card, including a cellular phone battery charging  
5 circuitry, coupled to the mobile PC for converting the first DC power into  
6 second DC power at a second voltage level in accordance to battery  
7 charging parameter information provided, and outputting the second DC  
8 power; and  
9 c) a cellular phone adapter cable for providing the battery  
10 charging parameter information to the cellular phone battery charging

11 circuitry of PCMCIA card, and for coupling the second DC power to a  
12 second battery of a cellular phone for charging the second battery.

1 19. The mobile computing system as set forth in claim 18 wherein the  
2 mobile computing system further comprises the cellular phone including  
3 the second battery.

1 20. The mobile computing system as set forth in claim 18 wherein the  
2 mobile PC comprises a.1) a receiver socket for mating with the PCMCIA  
3 card, and supplying the first DC power to the cellular phone battery  
4 charging circuitry of PCMCIA card.

1 21. The mobile computing system as set forth in claim 20, wherein  
2 the mobile PC further comprises a.2) control means coupled to the  
3 receiver socket for generating control signals for enabling/disabling the  
4 cellular phone battery charging circuitry of PCMCIA card through the  
5 receiver socket.

1 22. The mobile computing system as set forth in claim 18 wherein the  
2 PCMCIA card comprises:

3 b.1) a first connector for coupling the PCMCIA card to the mobile  
4 PC and receiving the first DC power at the first voltage level;

5 b.2) the cellular phone battery charging circuitry coupled to the  
6 first connector for receiving the first DC power, converting the first DC  
7 power into the second DC power at the second voltage level in

8 accordance to the battery charging parameter information received, and  
9 outputting the second DC power; and  
10 b.3) a second connector coupled to the cellular phone battery  
11 charging circuitry for coupling the PCMCIA card to the cellular phone  
12 adapter cable for receiving the battery charging parameter information  
13 from the cellular phone adapter cable and passing on to the cellular  
14 phone battery charging circuitry, and for receiving the second DC power  
15 and passing on the second DC power to the cellular phone adapter  
16 cable.

1 23. The mobile computing system as set forth in claim 18 wherein the  
2 cellular phone adapter cable comprises:  
3 c.1) a first connector for mating the cellular phone adapter cable  
4 with the PCMCIA card, providing the PCMCIA card with the battery  
5 charging parameter information, and receiving the second DC power at  
6 the second voltage level;  
7 c.2) a cable having a first end coupled to the first connector for  
8 transporting the second DC power; and  
9 c.3) a second connector coupled to a second end of the cable for  
10 mating with the cellular phone and providing the second DC power to  
11 the second battery of cellular phone.

1 24. In a mobile computing system comprising a cellular phone having  
2 a first battery, a method for charging the first battery of cellular phone  
3 comprising the steps of:  
4 a) outputting first DC power at a first voltage level by a mobile PC;

- 5           b) coupling the first DC power to cellular phone battery charging  
6 circuitry disposed in a PCMCIA card coupled to the mobile PC, and  
7 providing the cellular phone battery charging circuitry with battery  
8 charging parameter information of the first battery of cellular phone  
9 using a battery characteristic encoder disposed in a cellular phone  
10 adapter cable coupled to the PCMCIA card;
- 11           b) converting the first DC power to second DC power at a second  
12 voltage level, and outputting the second DC power by the cellular phone  
13 battery charging circuitry, in accordance to the battery charging  
14 parameter information provided; and
- 15           c) coupling the second DC power by the cellular phone adapter  
16 cable to the first battery of cellular phone and charging the first battery.

1   25.   The method as set forth in claim 24, wherein  
2           step a) further comprises outputting control signals by the mobile  
3 PC for enabling/disabling the cellular phone battery charging circuitry;  
4           step b) further comprises coupling the control signals to the  
5 cellular phone battery charging circuitry.

1   26.   The method as set forth in claim 25, wherein step a) is  
2 automatically performed by the mobile PC upon detecting a  
3 predetermined condition.

1   27.   The method as set forth in claim 26, wherein step a) further  
2 comprises continuous monitoring and storing of charge and control  
3 status of a second battery of mobile PC in predetermined locations of

4 mobile PC by mobile PC, and continuously monitoring for whether the  
5 predetermined condition has been met by mobile PC.

1 28. The method as set forth in claim 26, wherein step a) further  
2 comprises accepting control inputs, including decisional factors of the  
3 predetermined condition, through an user interface by mobile PC.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US95/16488

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) : G06F 13/00

US CL : 395/750, 835, 882

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 395/700, 821, 835, 882; 361/683; 363/49; 379/59

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

APS, JPOABS, COMPUTER SELECT

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	US, A, 5,313,642 (SEIGEL) 17 May 1994, Abstract, Detail Description	1 - 28
Y	US, A, 5,375,051 (DECKER ET AL) 20 December 1994, Abstract, Fig. 1, Summary	1 - 28

☐ Further documents are listed in the continuation of Box C.☐ See patent family annex.

* Special categories of cited documents:	* T	later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
* A* document defining the general state of the art which is not considered to be part of particular relevance	* X*	document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
* E* earlier document published on or after the international filing date	* Y*	document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
* L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	* &*	document member of the same patent family
* O* document referring to an oral disclosure, use, exhibition or other means		
* P* document published prior to the international filing date but later than the priority date claimed		

Date of the actual completion of the international search

05 MARCH 1996

Date of mailing of the international search report

18 MAR 1996
